

Carrier SIP Trunk Service

If you decide to develop your Hosted VoIP Service internally then both the servers and all call routing is entirely within your network. It requires you to purchase, implement and maintain a SIP Enabled Softswitch and a third party platform to provide the Hosted VoIP services and features. This “Carrier SIP” service is a “Supplemental Service” that allows you to expand your market nationwide.

- *Toly Provides Out-of-Territory Inbound Calling* - Toly can still help with getting new telephone numbers and to port existing numbers from outside of your serving area (Local and via Interconnect Agreements) to terminate to your switch. This requires a SIP trunk group connected to Toly’s services whereby you would purchase new numbers and port existing numbers nationwide as a resold wholesale service from Toly. Toly works with our underlying facility based local carriers to obtain the numbers and port numbers on your behalf. All calls to these numbers are then delivered to your SIP Enabled switch via an InBound SIP Trunk Group.
- *Toly Provides OutBound Long Distance and International Calling* – Toly, as it has done for many years, can provide your Long Distance and International call termination service via an OutBound SIP Trunk Group
